StealthBot - Bug #1231

Miner mines nearby rocks for extremely short periods of time before bounce-warping

Description

If I'm on a given high-priority rock, and the next best rock after this one is on the other side of the belt, when I end up popping the rock I'm on I will then swap to crystals for whatever other rocks are nearby and harvest them for a fraction of a cycle, wasting capacitor, wasting crystal durability, and looking blatantly like a bot.
