Description		
<p>This issue only affects miners jetcanning their ore. The issue is this: When mining large-yield ores with the jetcan on (and possibly smaller yield ores as well, hasn't happened with ore like veldspar or scord yet), the bots will occasionally come up with the in-game error of "not enough space in jetcan to transfer ore." I can see this as being quite a ban risk as the bot is directly transferring hard numbers into the jetcans and not realizing that there is not enough space in it. Furthermore, it is doing this constantly in a loop. I have a feeling this is being logged by the server and sending red flags.</p> <p>My proposal is to close out each jetcan every time the ore transfer completes. That way it should (in theory) update the ore counts when the bot re-opens the containers. Otherwise, I think the best course of action would be to ensure each bot transfers ore into its own containers only which can be accomplished through the container xml idea I submitted earlier (issue 1590).</p>
