

ISXEVE - Bug #2213

Customs Office entity .Name member acting odd

2022-07-17 07:49 AM - flibbidy

Status:	New
Priority:	Normal

Description

while attempting to add a list of customs offices from an entity iterator to a GUIlistbox, ive found that the listbox wouldnt take the .Name field as an AddItem method.

upon further investigation, when attempting to set the entity .Name member of a customs office to a string variable, the variable never sets.

could brackets in the name return be messing things up? (the name of the corporation who anchored the customs office is listed in the .Name return surrounded by [brackets])

History

nevermind. "quoting out" the :Set field solves the problem

```
objectname:Set["${objectIterator.Value.Name}"]
```
