

AstroBot - Bug #2023

Astrobot Marks Belt clear, even despite the checkbox in mining being unselected

Description	
<p>With both resetting the bot, and EWO, my foreman will often times mark a belt as "completed" without any warning, and despite there being more than enough minerals still left in the belt to warrant such actions.</p> <p>Unfortunately, this action does not change when deselecting "mark belt as cleared" in the mining action page.</p>

- Status changed from New to Rejected

This is not a bug.

AstroBot will mark a belt as cleared under the following conditions:

- When selective mining is enabled and all user selected types have been mined within the user defined scan radius.
- When strip mining is enabled and all asteroids within the user defined scan radius have been mined.

When marking a belt as cleared, by default it will write to a global file. The checkbox on the mining page changes this behavior to marking the belt as cleared inside of the navigation route file. This has the advantage of allowing a run through of belts for a specific type of ore and then another run through of those same belts using a different navigation file for a different type of ore.
