<b>Description</b>	
<p>Profile works fine with T1 strips. I move to T2, update the modules section, load some crystals in the cargo bay. I don't pre-load any into the module. Miner warps to a field, locks a target, loads the correct crystal. Once that ore type is mined out, and it swaps to another type it does <code>_not_</code> swap crystals even though they are in the cargo hold. I do have the "Use Mining Crystals" option checked.</p> <p>I've attempted to enable debugs to try and catch this, but don't see anything useful in the logs.</p> <p>This occurs when selective mining, mining with a foreman &amp; having the foreman pick the ore &amp; using the "strip mine" option.</p>
