

BJScripts - Error: Invalid Extension Version Mismatch

I am receiving the following message (## is the version number):

Invalid Extension Version. Inner Space is using ISXDK v##, and this extension was built with a different version. To use this extension, you need to download a new version that supports the latest interface. Extension 'ISXBJ' could not be loaded

OR

InnerSpace/Extensions/isxbj.dll could not be loaded into memory as a Win32 library

Either your ISXBJ.dll file was somehow corrupted or a new version of Innerspace has been downloaded that requires BJCasey to update ISXBJ (This occurs about once a year).

For immediate notification of when the new compatible extension is available you can [read the forums](#), use your own preferred IRC client, watch the home page of this site for news, or [for news to IRC from our website](#)
